The randomly www.stanford.edu/group/techdev/shear.htm). The randomly reheaved by shall fragments and DNA eluting in the void volume was subcloned into an EcoR V-digested, alkaline phosphatase-treated pBlueScript II (SK-) vector and transformed into E. coli strain XL2 Blue MRF'. Recombinant clones from the first plating of the library were selected for sequence analysis using T3 and T7
                                                                                                                                                                                                                                                                                                                                                                                                                      Cryptosporidium parvum.
Cryptosporidium parvum.
Eukaryota; Alveolata; Apicomplexa; Coccidia; Eimeriida;
Cryptosporidiidae; Cryptosporidium.

Treatment of auto-immune disease by admin. of peptide(s) corresp. to major histocompatibility complex antigens - esp. for delaying onset of cilinical symptoms of insulin dependent diabetes by modulating T cell madiated attack on target cells

Claim 7: Page 20; 24pp; English.

Worst Start Start Sepresent T-cell modulating peptides that can be used in the method of the invention. These sequences are based on a portion of the major histocompatability complex (MFC) class I antigen (see WOYSIO). The method is for affecting the course of an autoimmune disease involving T-cell mediated destruction of tissue in mammals. These involving T-cell mediated destruction of tissue in mammals. These course of specially to treat insulin-dependent diabetes mellitus, preferably being administered during the pre-clinical stage to delay onset of the disease. Other diseases that can be treated are multius, preferably being administered during the pre-clinical stage to delay onset of the peptides modulate T-cell mediated attack on autologous gravis, etc. The peptides modulate T-cell mediated attack on autologous cytokines, perforins, granzymes etc. associated with T cell activation. Sequence 10 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 4: Page 45: 103pp; English.
R71439-R71443 are human major histocompatibility complex class 1 (MHC 1) alpha 1 domain and HLA derived peptides and fusion peptides. They were used to modulate interactions between MHC 1/HLA and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplasias, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human HIA-A2-(62-85) antigen derived peptide.

A claimed cell-mediated fimune (CMI)-specific immunogenic compsn. comprises a conjugate of a primary antigen bearing a primary epitope, with an immunomodulatory peptide (IP), i.e. the present peptide. The Promprises an allopeptide molety of at least 5 anino acids, whose sequence corresponds to a polymorphic region of a MHC encoded polymorphic Class I or II antigen. The compsn. can be used to ellcit a CMI-specific response which is prophylactic, or therapeutic for, e.g. microbial and viral infections, parasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplasias, lupus erythematosus and arthritis.

Example 13; Page 32; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class I MHC HIA-A2. These sequences can be used to extend the period of The peptides are administered to a patient from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HLA-A2 CTL modulating peptide (A2.1.60-84). Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-A2.
New peptide(s) based on Class I HLA antigen domains - used for modulating cytocoxic T-lymphocyte activity towards targets brample 13: Page 39; 61pp: English.

The peptide is used to modulate cytocoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL infection. The peptide can also be used for identifying CTLs activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removang subsets of CTLs from a T-cell composition. This peptide is derived from the HLA-A2.1 antigen and corresponds to the amino acid positions 60-84 of that antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Clayberger C, Krensky AM, Parham P;

The We cell-mediated immune-specific immunogenic compsns. - used in prophylaxis and treatment of cancer, microbial infections, viral infections and parasitic infectations.

Example 1: Page 62: 141pp; English.

Scample 1: Page 62: 141pp; English.

A claimed cell-mediated fumune (CMI) *specific immunogenic compsn.

Comprises a conjugate of a primary antigen bearing a primary epitope, with an immunomodulatory peptide (IP), i.e. the present peptide.

Comprises an allopeptide moiety of at least 5 amino acids, whose sequence corresponds to a polymorphic region of a MHC encoded polymorphic class I or II antigen. The compsn. can be conceded polymorphic class I or II antigen. The compsn can be therefore the present class is microbial and viral infections, parasitic infestations and cancer, partic. MUC-1 expressing tumour cells when the present peptide is the IP, and a MUC-1 epitope is the

While Still 1940a. The companies of the modern of cris.

Tompsons. comprising lymphoid surface membrane proteins - which may may compans. Comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of Cris.

Example 7 9: 29pp. English.

Example 9: 29pp. English.

Example 7 160-84. These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein p74 from a T-cell surface membrane protein p74 confidence of the special protein p74 confidence of the passed through an affinity column containing a covalently bound HIA-B2702 paliadromic peptide.

Compositions comprising the extracellular fragment of p74 combined with the extracellular fragment of p74 condidate compounds can be screened for their effect on the cytolytic activity of treatment of for their effect on the cytolytic activity of determining the mount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74 in an amount sufficient to compete cuit the p74 for the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Percetion, purification and elimination of antigen-specific lymphocytes - for producing cytotoxic T cells for immuno-therapy of ancers and viral infection.

Example 2: Fig 10: 222pp; French.

Example 2: Fig 10: 222pp; French.

Coetween antigen-specific lymphocytes comprises forming a complex complex of antigen-specific lymphocytes comprises forming a complex complemently produced major histocompatibility complex (MHC) molecules, immobilising the complex and binding samples containing the antigen-specific lymphocytes. Expression of the MHC molecule in a cell is detected by antibodies against the MHC molecule or by an antibody to a chimeric MHC-marker protein, e.g. an MHC/Deta-2-microglobulin chimeric comprises the first 3 domains of the HLA-A2.1 heavy chain linked to human beta-2 microglobulin via a flexible linker. The method is also used to beta-2 microglobulin via a flexible linker. The method is also used to specific killing of tumour cells (solid tumours, leukaemia or lymphoma) by injection into a human or animal, but also for treating viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent claims epitopes of the HIV gp160 protein which are immunologically homologous to at least one epitope of the HLA immunologically homologous to at least one epitope of the HLA.

The patent family, preferably the HLA class 1 protein heavy chains. The present sequence is a region of the heavy chain alpha-1 domain, cw4 allele, to which the epitopes are homologous. In particular, the epitopes are homologous to the sequences TQKKRQAQ and NLRKLRGYY.

The identification of HLV gp160 epitopes homologous to HLA epitopes can be used to develop agents for vaccines and immunodiagnosis of HLY infection. The HLY phomologous HLA regions are able to induce anti-HLA autoantibodies and act as superantigens during the infection course, leading to a gradual and selective loss of certain T receptor families.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HIA epitope.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 13; Page 32; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequent corresponds to residues 60-84 of the alpha-1 domain of the class I MHC HLA-BW46. These sequences can be used to extend the period of
                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                   15-MAR-1994 (first entry)
Peptide fragment of Class I HLA peptide.
Human leukocyte antigen; HLA; peptide; transplantation; neoplasia;
parasitic disease; cytotoxic T lymphocyte; modulation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HIA-Bw46.60-64

A; Title: Segmental exchange between MHC class I genes in a higher primate: recombinat A; Reference number: S18197; MUID:91372865
A; Accession: S18197
A; Molecule type: nucleic acid
A; Residues: 1-354 <WAT>
                                                                                                                                     ö
